

## LISTING OF CLAIMS

1. (withdrawn) An attitude adjusting device for a sphere comprising a roller for rolling a sphere mounted thereon by a rotation, and a stopper for abutting on a protruded portion present on a surface of the sphere to stop the rolling of the sphere,

wherein the roller includes a portion having a small diameter which is concave along the surface of the sphere.

2. (withdrawn) The attitude adjusting device according to claim 1, wherein an axially sectional shape of a surface of the portion of the roller having a small diameter is a substantially circular arc and a radius R1 of the circular arc is 1.00 to 1.10 times as large as a radius R2 of the sphere.

3. (withdrawn) The attitude adjusting device according to claim 1, wherein the roller includes a plurality of grooves extended in an axial direction on a surface of the portion having a small diameter.

4. (withdrawn) An attitude adjusting device comprising a roller for rotating to roll a golf ball taken out of a mold and having a spew stuck onto a surface thereof in a state in which the golf ball is mounted thereon; and

a stopper for abutting on the spew to stop the rolling of the sphere,

wherein the roller includes a portion having a small diameter which is concave along the surface of the golf ball, and

an axially sectional shape of a surface of the portion of the roller having a small diameter is a circular arc and a radius R1 of the circular arc is 21.3 mm to 23.5 mm.

5. (withdrawn) The attitude adjusting device according to claim 4, wherein a rotating speed of the roller is 30 rpm to 130 rpm.

6. (withdrawn) The attitude adjusting device according to claim 4, wherein the stopper comprises two stopper parts opposed to each other with the golf ball interposed therebetween, positions of both of the stopper parts being set in such a manner that a difference (L - D) between a distance L between the stopper parts and a diameter D of the golf ball is 0.1 mm to 0.6 mm.

7. (currently amended) A golf ball manufacturing method comprising the steps of:  
forming a golf ball having a spew stuck onto a surface by a material put in a mold;  
rolling the golf ball over a roller including a portion having a small diameter which is  
concave along a surface of the golf ball, the roller having a plurality of grooves on a  
surface of the portion having the small diameter;  
stopping the rolling of the golf ball by abutment of the spew on a stopper;  
putting the golf ball on a machine for grinding with the attitude of the ball being kept; and  
removing the spew.
8. (previously presented) The method according to claim 7, wherein an axially sectional shape  
of a surface of the portion of the roller having a small diameter is a substantially circular arc and  
a radius R1 of the circular arc is 1.00 to 1.10 times as large as a radius R2 of the sphere.
9. (currently amended) The method according to claim 7, wherein ~~the roller includes a plurality  
of grooves extended~~ extend in an axial direction ~~on a surface of the portion having a small  
diameter~~.
10. (previously presented) The method according to claim 7, wherein an axially sectional shape  
of a surface of the portion of the roller having a small diameter is a circular arc and a radius R1  
of the circular arc is 21.3 mm to 23.5 mm.
11. (previously presented) The method according to claim 7, wherein a rotating speed of the  
roller is 30 rpm to 130 rpm.
12. (previously presented) The method according to claim 7, wherein the stopper comprises two  
stopper parts opposed to each other with the golf ball interposed therebetween, positions of both  
of the stopper parts being set in such a manner that a difference (L - D) between a distance L  
between the stopper parts and a diameter D of the golf ball is 0.1 mm to 0.6 mm.
